

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application. Please amend claims 7, 8 and 13 as follows:

LISTING OF CLAIMS:

Claims 1-6. (Canceled)

7. (Currently Amended) An image display system including a still image photographing apparatus, and an image processing apparatus connectable to said still image photographing apparatus, the image display system, comprising:

a mode setting unit for selectively switching said still image photographing apparatus between a photographing mode for taking a photographing action and a reproduction mode for displaying a recorded image;

a display for displaying an indicator through which an instruction for a photographing action is transmitted to said still image photographing apparatus; and

a controller for showing a photographed image display window to be displayed on said display when the photographing mode has been selected by said mode setting unit, and the object is photographed by said still image photographing apparatus in response to the instruction from said indicator.

8. (Currently Amended) A method for displaying image data taken by a still image photographing apparatus, the method including the steps of:

switching the still image photographing apparatus from a reproduction mode to a photographing mode;

displaying an indicator for transmitting an instruction of a photographing action to the still image photographing apparatus; and

displaying an image display window when the photographing mode has been selected, and the photographing action is taken by the still image photographing apparatus in response to the instruction.

9. (Previously Presented) An image processing apparatus connectable to a photographing apparatus, comprising:

an interface for connecting said image processing apparatus to said photographing apparatus;

a display which can display a plurality of windows and function indicators based on data processed by said image processing apparatus, wherein one of said windows shows said photographing apparatus and an indicator for transmitting a power-off instruction to said photographing apparatus in order to turn off the power source of said photographing apparatus; and

a controller for minimizing the window showing said photographing apparatus when the power-off instruction has been transmitted from said indicator for turning off the power of said photographing apparatus.

10. (Original) The image processing apparatus according to claim 9, wherein said window displayed on said display is closed when said photographing apparatus is disconnected from said image processing apparatus.

11. (Previously Presented) A method for controlling a photographing apparatus, the method including the steps of:

opening a window showing components of said photographing apparatus;
displaying as one of said components an indicator for transmitting a power-off instruction for turning off the power source of said photographing apparatus; and
minimizing the window to an iconic state when the power-off instruction has been transmitted from the indicator.

12. (Canceled)

13. (Currently Amended) A program product on a recording medium executable by a computer, wherein the program selectively switches a still image photographing apparatus connected to the computer between a reproduction mode and a photographing mode; displays an indicator for generating an instruction for a photographing action of the still image photographing apparatus on the computer; and displays a window for showing a photographed image on the computer when the photographing action has been taken in response to the instruction from the indicator.

14. (Previously Presented) A program product on a recording medium executable by a computer, wherein the program opens a window showing a photographing apparatus connected to the computer; displays an indicator for generating a power-off instruction for turning off the power source of the

photographing apparatus; and minimizes the window to an iconic state when the indicator has been actuated to generate the power-off instruction.

15. (Previously Presented) The image processing apparatus of claim 9, wherein said one window displays multiple components of said photographing apparatus, and the minimized window comprises an iconic representation of said photographing apparatus.
